An anterior myelomeningocele had been suspected in a female fetus on the basis of fetal ultrasonography; prenatal MRI at the 24<sup>th</sup> week of gestation confirmed a cystic mass in the anterior sacrococcygeal

area [1]. The mass was surgically removed at one month of age, and histopathological analysis determined it was a mature teratoma (Figure 1).

**Figure 1.** Prenatal diagnosis (fetal MRI): a tumor in the fetal sacrococcygeal area.
